An AI-driven Magnetic Resonance Imaging synthesis framework

Key challenge:

- Cross-comparison of magnetic resonance brain images acquired in different machines is difficult.
- MRs are often repeated, which is inefficient and time-consuming

Objective:

- Explore the efficacy of using modern generative models for synthesizing realistic MR imaging data using the T1-weighted images as input

Training datasets

- AOMIC ID 1000
- BraTS 2021 (total n ~2000)

Models: 3D-UNET (baseline), Pix2Pix-GAN

- Minibatch size 2
- LR=0.0001
- 150 epochs
- SSIM+L1 loss
